Kunii PREFACE The primary aim of this book is to present a coherent and self-contained description of recent advances in three-dimensional object recognition from range images. Three-dimensional object recognition concerns recognition and localization of objects of interest in a scene from input images. This problem is one of both theoretical and practical importance. On the theoretical side, it is an ideal vehicle for the study of the general area of computer vision since it deals with several important issues encountered in computer vision-for example, issues such as feature extraction, acquisition, representation and proper use of knowledge, employment of efficient control strategies, coupling numerical and symbolic computations, and parallel implementation of algorithms. On the practical side, it has a wide range of applications in areas such as robot vision, autonomous navigation, automated inspection of industrial parts, and automated assembly. 308 pp. Englisch.
