Excerpt: .isolated molecules or ions against the walls, it will be assumed that osmosis is due simply to the mutual attraction of small particles of solid matter and their solvents. It depends also on the molecular attraction which converts solid bodies into solutions, and which so operates that the dissolved substances become uniformly distributed throughout the solution. When two solutions of unequal concentration are separated by a membrane which is equally permeable to both, an attraction and diffusion of both liquids will take place through the separating membrane. If, however, the membrane is more easily permeated by one of the solutions than by the other, then a larger quantity of the one than the other will pass through it; and, in case the membrane is only permeable for one solution, that one alone will be drawn through it. If a pig's bladder be filled with...
